INTRODUCTION

These International Alcoholometric Tables complete the International Recommendation N° 22 "Alcoholometry" approved by the Fourth International Conference of Legal Metrology (see page 9).

The purpose of this Recommendation and of these Tables is to harmonize at international level the basic data relating to the density and to the alcoholic strengths by mass and by volume of mixtures of water and ethanol, used in all countries by the Institutions and Administrations concerned (customs, finances, alcohol monopolies, etc...).

Disagreements likely to impede international trade will be avoided by using these tables for the calculation of alcoholic strengths.

The purpose of this introduction is to outline briefly the principles followed for the establishment of these tables.

1 — MEASUREMENTS of the DENSITY of MIXTURES of WATER and ETHANOL USED as a BASIS for ALCOHOLOMETRIC TABLES

It was decided to use the results of all initial measurements on which the national tables used until now are based, in so far as they are sufficiently accurate and can be acknowledged to be good, given the present state of the measuring technique.

These international alcoholometric Tables can be considered the synthesis of all national alcoholometric tables used until now.

These measurements are as follows :

- a) KAWASAKI — MINOWA — INAMATSU (National Research Laboratory of Metrology — Tokyo)
 - measurements of the relative density of mixtures of water and ethanol at the temperatures of 15 °C, 20 °C, 25 °C, 30 °C, International Practical Temperature Scale of 1948, (these measurements have been translated into IPTS 68);
 - determination by extrapolation of the density of pure and anhydrous ethanol at 25 °C (from samples of almost anhydrous ethanol and by titration according to the Karl FISCHER method);
 - measurements of the relative density between — 20 °C and + 15 °C by means of pycnometers; determination of alcoholic strengths by mass as calculated from previous measurements.
- b) JAULMES — BRUN — TEP (Laboratory of Analytical Chemistry and of Toxicology of the Faculty of Pharmacy of Montpellier)
 - measurements of the density of practically anhydrous ethanol at $t = 20$ °C (IPTS 48);
 - measurements by means of pycnometers of the density of mixtures of water and ethanol at 20 °C, and chemical analysis of these mixtures to determine the degree of ethanol.

for more detailed information, see :

E. PLUNIAN - OIML bulletin n° 31 (March 1968)

H. WAGENBRETH - OIML bulletins n° 51 and 52 (June and September 1973).

- c) OSBORNE—Mc KELVY—BEARCE (National Bureau of Standards—Washington)
 - measurements of the density of mixtures of water and ethanol at 15 °C and 25 °C. (these mixtures having been obtained from almost anhydrous ethanol);
 - measurements, between 10 °C and 40 °C, of the density of mixtures of water and ethanol whose alcoholic strength by mass has been determined from previous measurements.
- d) MENDELEEV
 - various measurements (reconsidered by GEORGIEVSKII)
- e) WAGENBRETH (Physikalisch - Technische Bundesanstalt — Braunschweig)
 - measurements of density between — 20 °C and + 20 °C of mixtures of water and ethanol by means of sinkers and pycnometers, the alcoholic strength by mass of these mixtures being calculated from the density at 20 °C and from the tables of PLEBANSKI and OGONOWSKA (concurring with the measurements of OSBORNE — Mc KELVY and BEARCE).

2 — DETERMINATION of the FORMULA GIVING the DENSITY
 of a MIXTURE of WATER and ETHANOL
 from the ALCOHOLIC STRENGTH by MASS
 and from the TEMPERATURE

The chosen analytical form of the function is :

$$\varrho = \sum_{i=1}^m \sum_{k=1}^n a_{i,k} p^{k-1} (t - 20 \text{ } ^\circ\text{C})^{i-1}$$

ϱ being the density of the mixture

p being the alcoholic strength by mass expressed in decimals (*)

t being the temperature (IPTS 68)

The density of pure and anhydrous ethanol at 20 °C was obtained from the work of JAULMES — BRUN — TEP, who have also calculated certain intermediate values of the density at 20 °C of mixtures.

For $t = 20 \text{ } ^\circ\text{C}$, an initial formula of approximation was calculated by using the least squares method in the form :

$$\varrho_{20 \text{ } ^\circ\text{C}} = A_1 + \sum_{k=2}^n A_k p^{k-1}$$

The study of the standard deviation of the density $\varrho_{20 \text{ } ^\circ\text{C}}$ as a function of the degree $n - 1$ of the polynomial served to show that there was no point in exceeding the value $n = 12$. The coefficients A_k , first calculated with sixteen figures, were later rounded off to ten figures.

The values calculated from the polynomial differ from JAULMES' values rounded off to 0.01 kg/m³ (for alcoholic strengths expressed in integral per cent) by :

0.02 kg/m³ at 5 points

0.01 kg/m³ at 38 points

and are equal to the JAULMES' values for the other points.

(*) for example, if the alcoholic strength by mass is : 12 %, $p = 0.12$.

For $p = 0$ (water saturated with air), the values used were those given by WAGENBRETH and BLANKE which led to the formula :

$$\varrho_w = A_1 + \sum_{k=1}^6 B_k (t - 20 \text{ } ^\circ\text{C})^k$$

The general formula giving the density of a mixture was therefore written in the form :

$$\varrho = A_1 + \sum_{k=2}^{12} A_k p^{k-1} + \sum_{k=1}^6 B_k (t - 20 \text{ } ^\circ\text{C})^k + \sum_{i=1}^n \sum_{k=1}^{m_i} C_{i,k} p^k (t - 20 \text{ } ^\circ\text{C})^i$$

The coefficients $C_{i,k}$ were calculated, by using the least squares method, for different numerical vectors ($n ; m_1, m_2, \dots, m_n$) in order to determine the optimal number of coefficients $C_{i,k}$, by studying the standard deviation of the basic values of the equation for each vector ($n ; m_1, \dots, m_n$).

The basic definitions, the analytical form of the formula, and the values of the coefficients, are described in the international Recommendation n° 22 "Alcoholometry" reproduced below.

3 — INTERNATIONAL ALCOHOLOMETRIC TABLES

The International Committee of Legal Metrology, in accordance with the suggestion of the OIML Reporting Secretariat concerned (France), has decided that the International Organisation of Legal Metrology would publish the 5 following fundamental Alcoholometric Tables :

Table I : gives the density of a mixture as a function of the temperature (varying, in $^\circ\text{C}$, from $-20 \text{ } ^\circ\text{C}$ to $+40 \text{ } ^\circ\text{C}$) and of the alcoholic strength by mass (varying, by 1 %, between the minimum permissible value and 100 %, this minimum value corresponding to the freezing of the mixture for the temperature considered).

Table II : gives the density of a mixture as a function of the temperature (varying, in $^\circ\text{C}$, from $-20 \text{ } ^\circ\text{C}$ to $+40 \text{ } ^\circ\text{C}$) and of the alcoholic strength by volume (varying, by 1 %, between the minimum permissible value and 100 %).

Table III : gives the density at $20 \text{ } ^\circ\text{C}$ (table IIIa) and the alcoholic strength by volume (table IIIb) as a function of the alcoholic strength by mass, varying, by 0.1 %, between 0 and 100 %.

Table IV : gives the density at $20 \text{ } ^\circ\text{C}$ (table IVa) and the alcoholic strength by mass (table IVb) as a function of the alcoholic strength by volume, varying, by 0.1 %, between 0 and 100 %.

Table V : gives the alcoholic strength by mass (table Va) and the alcoholic strength by volume (table Vb) as a function of the density at $20 \text{ } ^\circ\text{C}$, varying, by 0.1 kg/m^3 , between 789.3 kg/m^3 and 998.2 kg/m^3 .

4 — METHOD of CALCULATION of the TABLES

Due to the complexity of the calculations, alcoholometric tables are worked out by computer.

Tables I and IIIa are calculated directly from the general formula. Table IIIb is calculated by the formula :

$$q = \frac{\varrho_{20 \text{ } ^\circ\text{C}}}{\varrho_{20 \text{ } ^\circ\text{C}} (100 \text{ } \%)} \times p$$

q being the alcoholic strength by volume, p the alcoholic strength by mass, $\varrho_{20 \text{ } ^\circ\text{C}}$ being itself calculated as a function of p from the general formula and $\varrho_{20 \text{ } ^\circ\text{C}} (100 \text{ } \%)$ being the density at $20 \text{ } ^\circ\text{C}$ of pure ethanol (= 789.24 kg/m^3).

Table IVb is calculated by interpolation from table IIIb.

Tables II and IVa are obtained by calculating first by interpolation (from table IIIb) the values of the alcoholic strength by mass as a function of the alcoholic strength by volume, then by using the general formula to calculate the values of the density from the alcoholic strength by mass thus determined, and from the temperature.

Tables Va and Vb are obtained by interpolation from tables IIIa and IIIb.

It is necessary to use a sufficient number of decimals (16) for the calculations required to establish the tables. Moreover, for the tables calculated by interpolation, it is mandatory, in the intermediate calculations, to use the non-rounded off values determined from the general formula or from the formula connecting q to p , and not the rounded off values.

Furthermore, for the tables calculated by interpolation, it is necessary that the interpolation interval for the alcoholic strength by mass be sufficiently small (0.1 % mass in the case of a linear interpolation).

A N N E X I

PRACTICAL ALCOHOLOMETRIC TABLES

The general formula or the fundamental alcoholometric tables allow the establishment of numerous practical alcoholometric tables which can be used during various measuring processes relating to mixtures of water and ethanol.

This annex gives a list of these practical tables and indicates methods which can be used to establish them.

note = in the case of tables which are a function of the temperature, the maximum range is [— 20 °C, + 40 °C].

Table VI : gives the value of the alcoholic strength by mass of a mixture as a function of its Celsius temperature t and of its density at this temperature.

This table is obtained by interpolation from table I.

Table VII : gives the alcoholic strength by volume of a mixture as a function of its Celsius temperature t and of its density at the same temperature.

This table is obtained from table VI and the formula connecting the alcoholic strength by volume to the alcoholic strength by mass (see § 4 of the introduction).

Tables VIIIa and VIIIb : give respectively the value of the alcoholic strength by mass and of the alcoholic strength by volume of a mixture at the Celsius temperature t from the reading of an alcorometer made of soda lime glass*, graduated either in units of alcoholic strength by mass (% mass), or in units of alcoholic strength by volume (% vol).

A density at 20 °C called $\rho'_{20^{\circ}\text{C}}$ corresponds to the value read from the alcorometer, according to table IIIa or IVa respectively.

The true density at the Celsius temperature t of the mixture is given by the formula :

$$\rho_t = \rho'_{20^{\circ}\text{C}} [1 - a(t - 20^{\circ}\text{C})]$$

a being the cubical coefficient of expansion of soda lime glass ($25 \cdot 10^{-6} \text{ }^{\circ}\text{C}^{-1}$).

From the value ρ_t thus calculated and from the temperature t , the value of the alcoholic strength by mass or of the alcoholic strength by volume can be read respectively from table VI or VII.

(*) Soda lime glass : also called « ordinary glass ».

Tables IXa and IXb : give respectively the value of the alcoholic strength by mass and of the alcoholic strength by volume of a mixture at the Celsius temperature t from the reading of a hydrometer for alcohol in soda lime glass.

The formula of the preceding tables VIIIa and VIIIb, in which $\varrho'_{20^\circ\text{C}}$ is replaced by the value read from the hydrometer, gives the density of the mixture at the Celsius temperature t .

The alcoholic strength by mass or the alcoholic strength by volume can be read from tables VI or VII respectively.

Tables Xa and Xb : give respectively the value of the alcoholic strength by mass and of the alcoholic strength by volume of a mixture at the Celsius temperature t from the measurement of the density of this mixture by means of an instrument made of borosilicate glass.

The same method as that used for the preceding tables IXa and IXb is used, assuming the cubical coefficient of expansion of borosilicate glass to be $10.0 \cdot 10^{-6} \text{ } ^\circ\text{C}^{-1}$.

Tables XIa and XIb : give in cubic decimetres the volume v at 20°C of pure ethanol contained in 100 dm^3 of a mixture of known alcoholic strength by mass or volume at the Celsius temperature t , assuming that the volume of 100 dm^3 was measured by a container in steel calibrated at 20°C — cubical coefficient of expansion of steel : $\beta = 36 \cdot 10^{-6} \text{ } ^\circ\text{C}^{-1}$.

Either of the two following formulae can be used :

$$v = \frac{p}{100} \frac{\varrho_t}{\varrho_{20^\circ\text{C}} (100\%)} [1 + \beta (t - 20^\circ\text{C})] \times 100$$

$$v = \frac{q}{100} \frac{\varrho_t}{\varrho_{20^\circ\text{C}}} [1 + \beta (t - 20^\circ\text{C})] \times 100$$

in which

the alcoholic strengths by mass p and by volume q are expressed respectively in % mass or in % vol,

ϱ_t is given as a function of p by table I, and of q by table II,

$\varrho_{20^\circ\text{C}}$ is given as a function of q by table IVa

$\varrho_{20^\circ\text{C}} (100\%)$ is the density of pure ethanol.

Tables XIIa and XIIb : give in cubic decimetres the volume v at 20°C of pure ethanol contained in 100 kg of a mixture of known alcoholic strength by mass or by volume at the Celsius temperature t , (it is assumed that the weighing took place in air whose density was 1.2 kg/m^3 , by means of weights characterized by the conventional value of the result of their weighing in air — see international Recommendation n° 33).

Either of the two following formulae can be used :

$$v = \frac{p}{100} \frac{10^3}{\varrho_{20^\circ\text{C}} (100\%)} [1 - 1.2 (1/8 000 - 1/\varrho_t)] \times 100$$

$$v = \frac{q}{100} \frac{10^3}{\varrho_{20^\circ\text{C}}} [1 - 1.2 (1/8 000 - 1/\varrho_t)] \times 100$$

(the symbols have the same meanings as in tables XIa and XIb).

A N N E X I I

CORRECTION of SURFACE TENSION

The reading from an alcoholometer or hydrometer used for the measurement of the strength of ethanol or of the density of a mixture of water and ethanol depends somewhat on the surface tension of the liquid.

The instruments have to be adjusted in such a way as to give an accurate reading at the reference temperature of 20 °C and for a liquid whose surface tension is γ (20 °C), this value having been taken from the table below.

In a case where the measurement is performed at a temperature which differs notably from that of 20 °C, it is necessary to add the correction K to the reading of the instrument :

$$K = \frac{4}{gEd\varrho} [\gamma - \gamma(20 \text{ } ^\circ\text{C})]$$

with E = sensitivity of the instrument

d = diameter of the stem of the instrument

ϱ = density of the liquid

g = acceleration due to gravity

γ = surface tension — see table below.

Surface tension γ of a mixture of water and ethanol in mN/m
as a function of the alcoholic strength by mass p and of the Celsius temperature t .

INTERNATIONAL ORGANISATION OF LEGAL METROLOGY

**INTERNATIONAL BUREAU OF LEGAL METROLOGY
11, RUE TURGOT — 75009 PARIS — FRANCE**

INTERNATIONAL RECOMMENDATION No 22

ALCOHOLOMETRY

“ International alcoholometric tables ”

**Secrétariat-rapporteur OIML :
FRANCE**

**Fourth International Conference of Legal Metrology - October 1972
First edition 1973**

ALCOHOLOMETRY

1. Purpose of the Recommendation.

The purpose of this Recommendation is :

- 1° to define the manner in which the proportion of ethyl alcohol (ethanol) in a water/alcohol mixture is to be expressed and the measurements which are to be made for its determination.
- 2° to adopt tables which will permit the proportion to be calculated from the measurements made.

2. Alcoholic strengths.

The « alcoholic strength by volume » of a mixture of water and alcohol is the ratio of the volume of alcohol, measured at 20 °C, contained in the mixture to the total volume of the mixture, measured at the same temperature.

The « alcoholic strength by mass » of a mixture of water and alcohol is the ratio of the mass of the alcohol contained in the mixture to the total mass of the mixture.

3. Expression of alcoholic strengths.

Alcoholic strengths are expressed in parts of alcohol per hundred parts of mixture.

Their symbols are :

- « % vol » for the alcoholic strength by volume.
- « % mass » for the alcoholic strength by mass.

4. Determination of alcoholic strength.

The operations to be performed in order to arrive at the proportion of alcohol are :

- a the reading of the alcoholometer or of the hydrometer, or the weighing of the pycnometer, at the temperature of the mixture.
- b the measurement of the temperature of the mixture.

The results are read off from the International Alcoholometric Tables.

5. Instruments.

Instruments which may be used for determining alcoholic strength are :

- a) hydrometers, graduated at the reference temperature of 20 °C :
 - either in units of density, called « hydrometers for alcohol »,
 - or in units of alcoholic strength by volume, called volume alcoholometers,
 - or in units of alcoholic strength by mass, called mass alcoholometers ;
- b) pycnometers.

6. International Alcoholometric Tables.

6.1. The International Alcoholometric Tables are based on calculations or the results of measurements made by :

D.I. MENDELEEV,

N.S. OSBORNE, E.C. McKELVY and E.W. BEARCE
(National Bureau of Standards) — UNITED STATES OF AMERICA

T. PLEBANSKI and B. OGONOWSKA
(National Bureau of Quality and Measures) — POLAND

T. KAWASAKI, Z. MINOWA and T. INAMATSU
(National Research Laboratory of Metrology) -- JAPAN

P. JAULMES, S. BRUN and Y. TEP
(Montpellier Faculty of Pharmacy) — FRANCE

H. WAGENBRETH
(Physikalisch - Technische Bundesanstalt) — FED. REP. GERMANY

L. NYKANEN
(International Union of Pure and Applied Chemistry)

6.2. The « International alcoholometric tables » can be calculated (*) by means of the Formula of H. WAGENBRETH and W. BLANKE (Physikalisch-Technische Bundesanstalt - FED. REP. GERMANY) as follows.

(*) the Tables which will be published subsequently by OIML will have 5 significant figures.

FORMULA
for calculating the ALCOHOLOMETRIC TABLES
for mixtures of ethyl alcohol and water

The density « ρ » expressed in kilograms per cubic metre (kg/m^3), of a mixture of ethyl alcohol and water at a temperature t , expressed in degrees Celsius, is given by the Formula below as a function of :

- the alcoholic strength by mass p expressed as a decimal, (*)
- the temperature t expressed in degrees Celsius, (I.P.T.S. 68)
- the numerical coefficients below.

The formula is valid for temperatures lying between — 20 °C and + 40 °C.

$$\rho = A_1 + \sum_{k=2}^{12} A_k p^{k-1} + \sum_{k=1}^6 B_k (t - 20 \text{ } ^\circ\text{C})^k + \sum_{i=1}^n \sum_{k=1}^{m_i} C_{i,k} p^k (t - 20 \text{ } ^\circ\text{C})^i.$$

$n =$	5
$m_1 =$	11
$m_2 =$	10
$m_3 =$	9
$m_4 =$	4
$m_5 =$	2

(*) eg : for an alcoholic strength by mass of 12 % : $p = 0.12$.

temperature (IPTS 68)	t	»	»	°C

T A B L E I

$$\varrho = \varrho(p, t)$$

Masse volumique fonction de la température et du titre massique

pas : 1 °C ; 1 % masse

température : de — 20 °C à + 40 °C

T A B L E I : $\varrho = \varrho(p, t)$ (see pages 16 to 27 of the French text)

Density as a function of the temperature and of the alcoholic strength by mass

interval : 1 °C ; 1 % mass

temperature : from — 20 °C to + 40 °C

T A B L E II : $\varrho = \varrho(q, t)$ (see pages 30 to 41 of the French text)

Density as a function of the temperature and of the alcoholic strength by volume

interval : 1 °C ; 1 % vol

temperature : from — 20 °C to + 40 °C

T A B L E IIIa : $\varrho_{20^\circ\text{C}} = \varrho_{20^\circ\text{C}}(p)$ (see pages 44 and 45 of the French text)

Density at 20 °C as a function of the alcoholic strength by mass

interval : 0.1 % mass

T A B L E IIIb : $q = q(p)$ (see pages 48 and 49 of the French text)

Alcoholic strength by volume as a function of the alcoholic strength by mass

interval : 0.1 % mass

T A B L E IVa : $\varrho_{20^\circ\text{C}} = \varrho_{20^\circ\text{C}}(q)$ (see pages 52 and 53 of the French text)

Density at 20 °C as a function of the alcoholic strength by volume

interval : 0.1 % vol

T A B L E IVb : $p = p(q)$ (see pages 56 and 57 of the French text)

Alcoholic strength by mass as a function of the alcoholic strength by volume

interval : 0.1 % vol

T A B L E Va : $p = p(\varrho_{20^\circ\text{C}})$ (see pages 60 to 64 of the French text)

Alcoholic strength by mass as a function of the density at 20 °C

interval : 0.1 kg/m³

density : from 789.3 kg/m³ to 998.2 kg/m³

T A B L E Vb : $q = q(\varrho_{20^\circ\text{C}})$ (see pages 66 to 70 of the French text)

Alcoholic strength by volume as a function of the density at 20 °C

interval : 0.1 kg/m³

density : from 789.3 kg/m³ to 998.2 kg/m³
